## Lessons from CoRoT

Marc Ollivier

Institut d'Astrophysique Spatiale d'Orsay  
LESIA – Observatoire de Paris

© CNES - Mai 2004/Bus: D. Ducros

## CoRoT in Brief

- « Small » CNES Mission + Belgium + Germany + Austria + Spain + Brasil+ ESA
- 3<sup>rd</sup> PROTEUS mission (minisat)
- Double program : asteroseismology and search for planetary transits
- Launch : 27 Dec 2006 : Soyuz Starsem 2b from Baïkonour
- Circular polar orbit at 896 km
- Loss of detection chain 2 in March 2009
- Loss of detection chain 1 in Nov 2012
- End of the mission june 2013
- End of operations june 2014

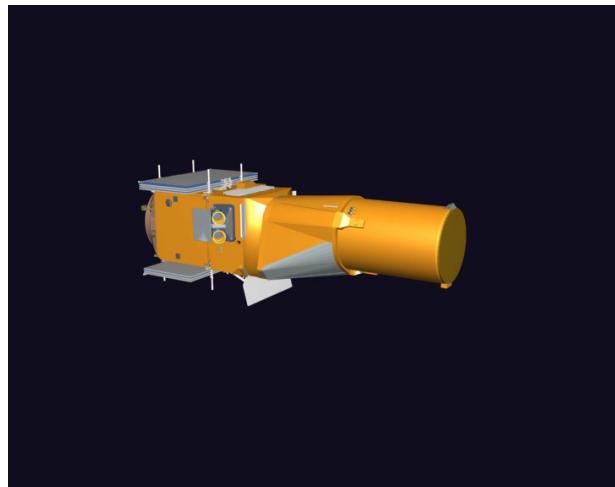

2

CHEOPS Workshop - Madrid - 18 june 2015

## The CoRoT observatory

## The focal plane

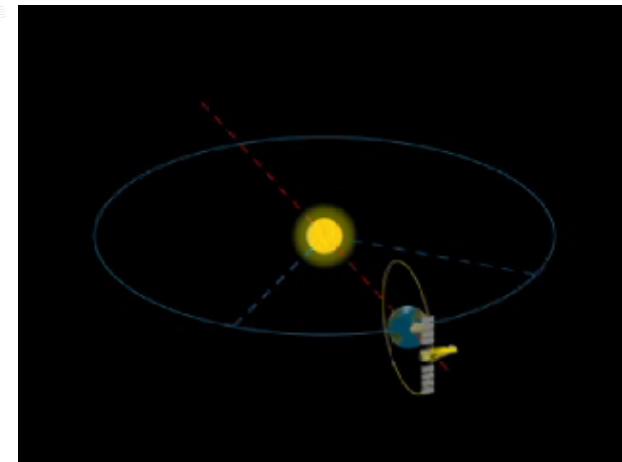

CHEOPS Workshop - Madrid - 18 june 2015

5

## CoRoT : Observation and orbital constraints

CHEOPS Workshop - Madrid - 18 june 2015

6

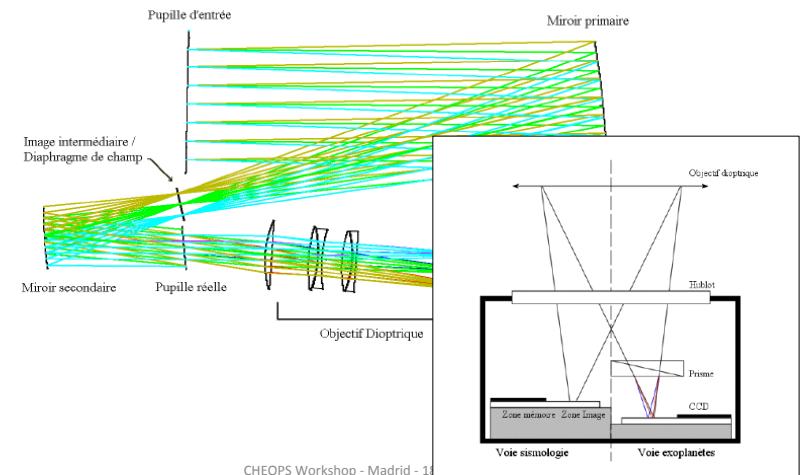

1st lesson : it is necessary to understand as much as possible how the instrument works and responds

CHEOPS Workshop - Madrid - 18 june 2015

7

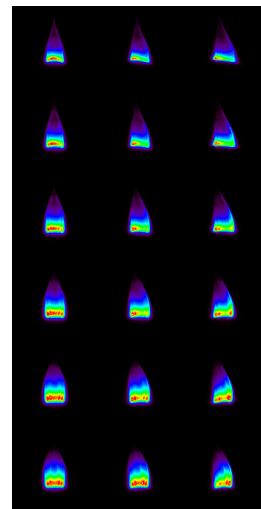

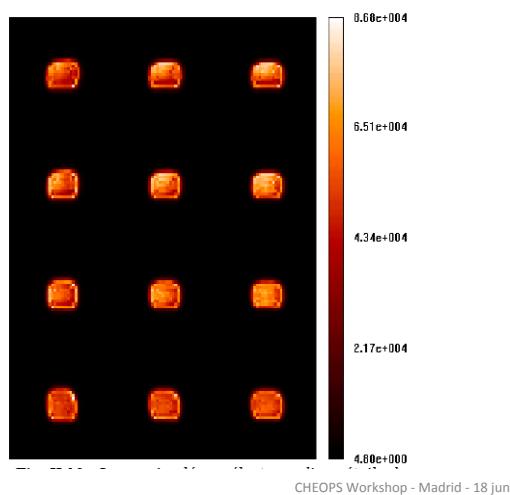

## Modeling of optical chain

CHEOPS Workshop - Madrid - 18 june 2015

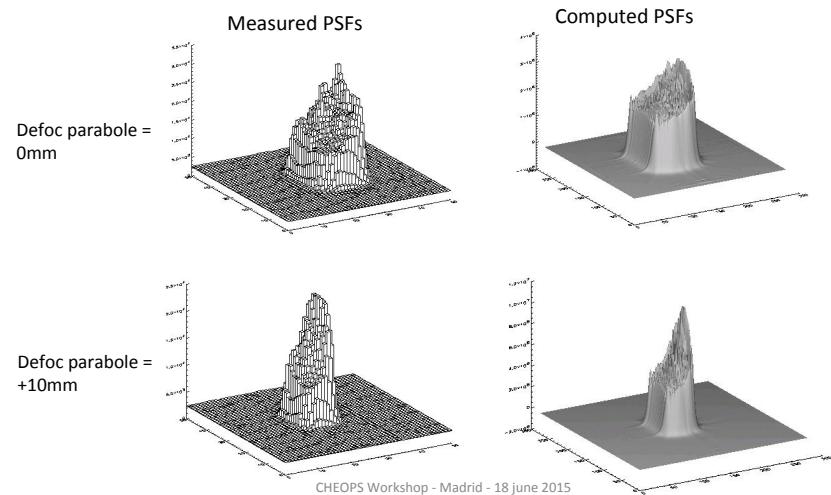

## Modeling of optical chain

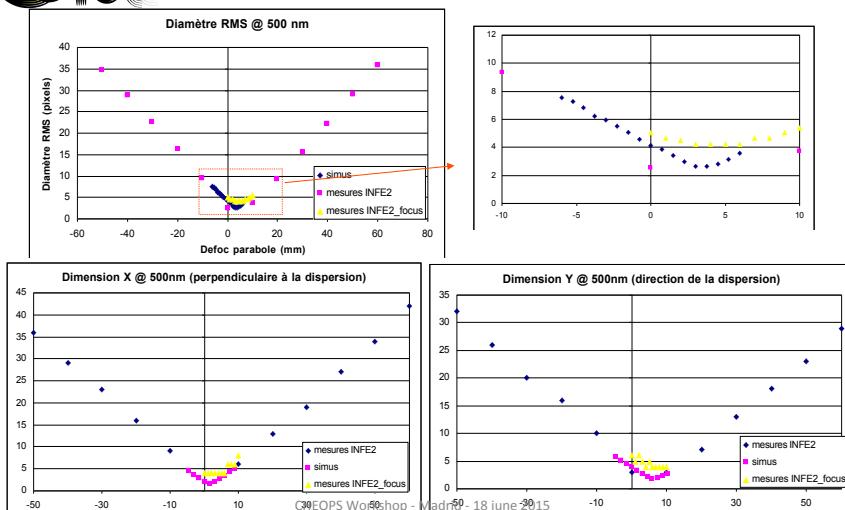

9

## PSFs Huygens at INFA2 point

## Comparing simulation and measurements

## Defining the detection chain

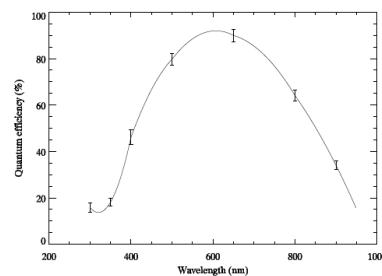

Paramètre		Min	Typ	Max
Transfert ligne image => mémoire	[μs]	80	100	
Transfert d'un pixel dans le registre sans numérisation	[μs]	0,5	1	
Transfert d'un pixel dans le registre avec numérisation	[μs]	10		
Gain de l'amplificateur de sortie CCD	[μV/e]	3,8	4,5	6
Bruit de l'amplificateur de sortie à 100 KHz	[e·rms]		5	
Courant d'obscurité moyen à -40°C	[e·pix <sup>-1</sup> .s <sup>-1</sup> ]		0,5	
QE moyen :	[%]			
300 nm		7		
350 nm		15		
400 nm		50		
500 nm		88		
650 nm		86		
800 nm		65		
900 nm		33		
PRNU local :	[% c-c]			
350 nm		9		
450 nm		7		
550 nm		7		
650 nm		7		
750 nm		8		
850 nm		10		
Cosmétiques : obscurité > 100 e <sup>-</sup> .s <sup>-1</sup> ou réponse < 50 %	[nb pixels] [nb colonnes]		750	
Capacité des pixels	[10 <sup>3</sup> e <sup>-</sup> ]	80	100	
Capacité du registre	[10 <sup>3</sup> e <sup>-</sup> ]	400	450	
Capacité du summing well	[10 <sup>3</sup> e <sup>-</sup> ]	800	1000	

CHEOPS Workshop - Madrid - 18 june 2015

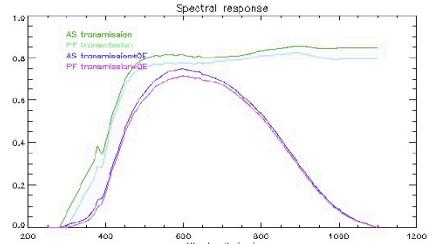

12

## And checking the specifications

Data given by E2V

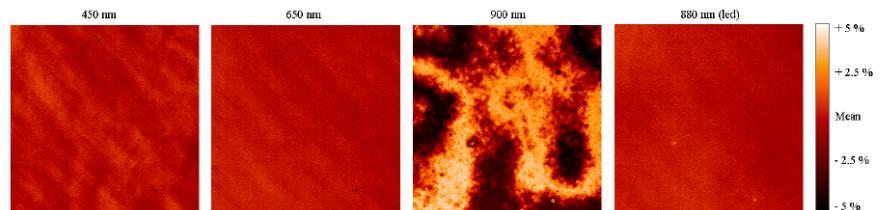

Auvergne et al (2009)

CHEOPS Workshop - Madrid - 18 june 2015

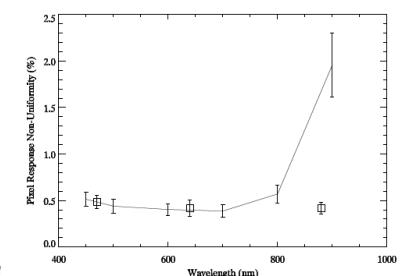

13

## Calibrating the detection chain PRNU

PRNU @ 450, 650, 900 nm ( $\delta\lambda=10\text{nm}$ )  
and 880 nm ( $\delta\lambda=80\text{nm}$ )

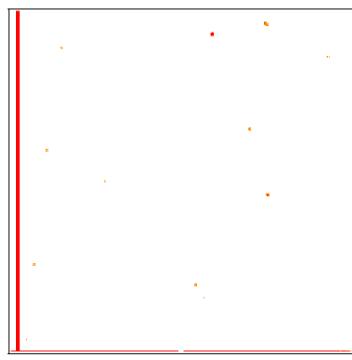

Lapeyrere (2006)

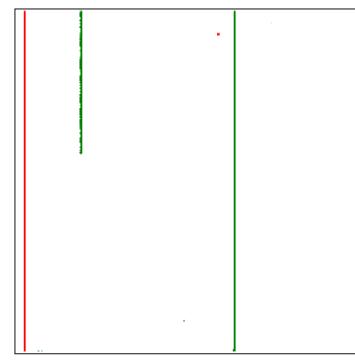

CHEOPS Workshop - I

## Calibrating the detection chain Bright star channel

a)

b)

- dark defect
- jitter defect (level 1)
- jitter defect (level 2)

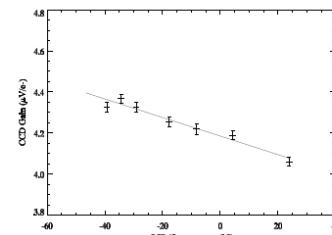

Lapeyrere (2006)

CHEOPS Workshop - Madrid - 18 june 2015

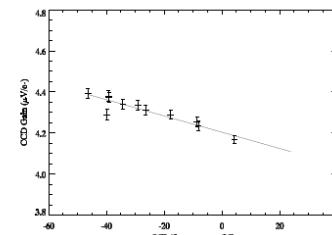

15

## CCD gain variation with T

a)

b)

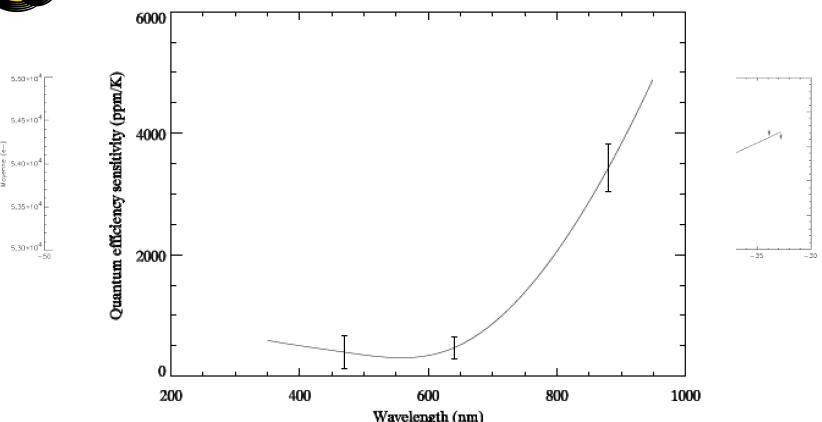

Lapeyrere (2006)

20

## Well capacity and saturation

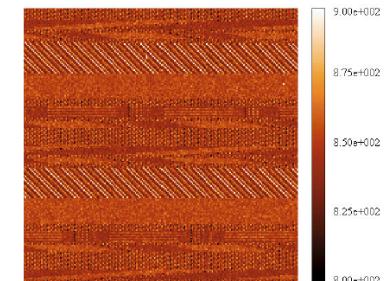

Lapeyrere (2006)

CHEOPS Workshop - Madrid - 18 june 2015

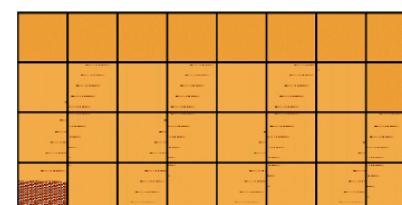

21

## Cross talks

Faint stars channel (32s)

Bright stars channel (1s)

Auvergne et al (2009)

22

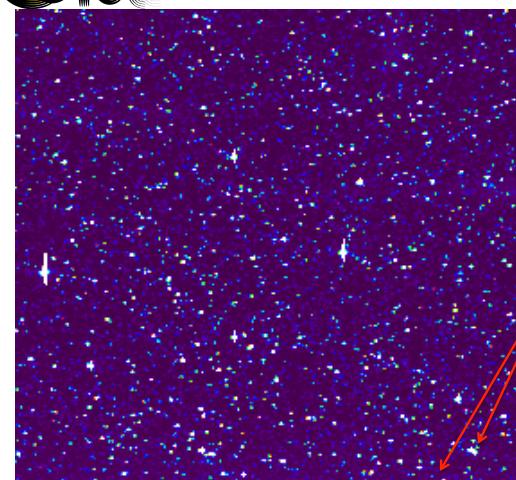

Lesson 2 : it is necessary, but not always sufficient

CHEOPS Workshop - Madrid - 18 june 2015

23

## CCD saturation

Some stars saturate the DAC  
before the CCD (i.e : FWC much  
larger than measured)

CHEOPS Workshop - Madrid - 18 june 2015

24

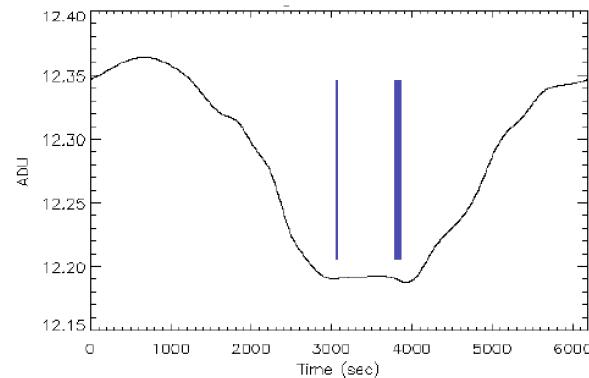

## Lesson 3 : the worst is not necessary mandatory

CHEOPS Workshop - Madrid - 18 june 2015

25

## The baffle efficiency

Rejection  $\sim 10^{13}$  : difficult to model, impossible to measure in the lab

Auvergne et al (2009)  
26

## Lesson 4 : you should be prepared to work on your data

CHEOPS Workshop - Madrid - 18 june 2015

27

## Preparing the exploitation phase

- Data reduction pipelines should be ready before the launch
- They should have been tested on « real-like » data (format, dynamics range...)
- You should know what you expect...
  - Biases
  - Noise
- You should be prepared to correct what you expect
- You should be prepared to correct what you don't expect
- You should expect what you don't know how to correct

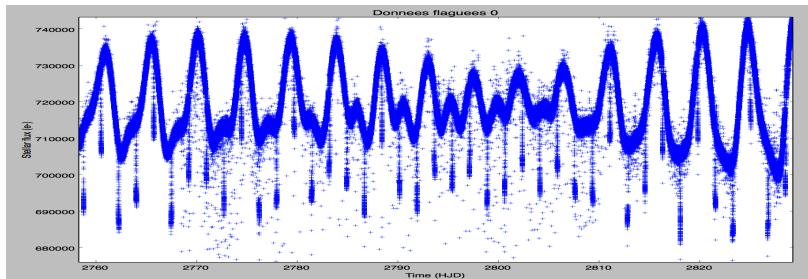

CHEOPS Workshop - Madrid - 18 june 2015

28

## Preparing the exploitation phase

- Simulated data are always simulated data
- Don't be too proud of you if you manage to extract signal from simulated data : real biases and noises should have been forgotten or underestimated... (I'm joking, blind tests are useful !!!)

Lesson 5 : even if your pipelines are (finally!) ready, you will need to improve them continuously

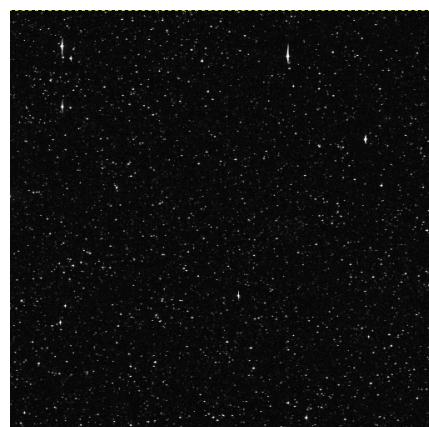

(because time is a perpetual instrument killer...)

CHEOPS Workshop - Madrid - 18 june 2015

30

## Investigation tools

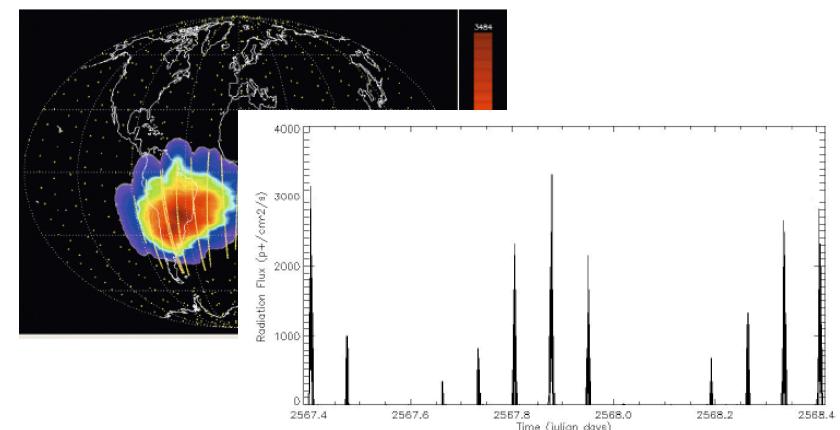

CHEOPS Workshop - Madrid - 18 june 2015

31

## Protons impacts

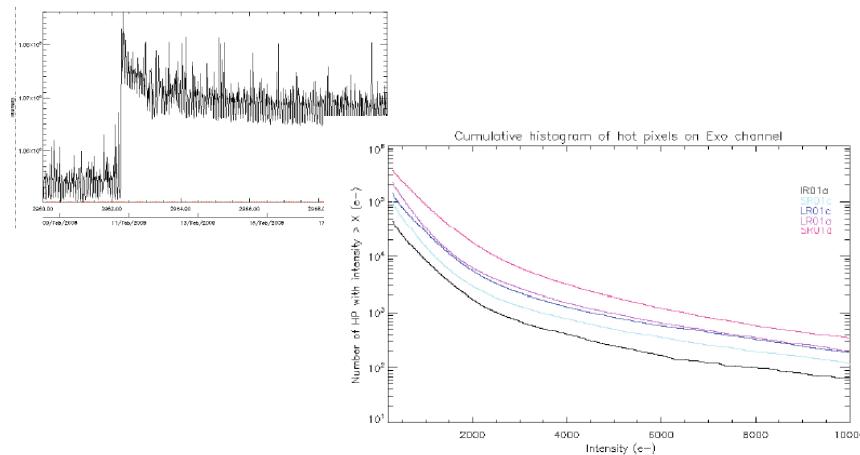

CHEOPS Workshop - Madrid - 18 june 2015

32

## Protons impacts

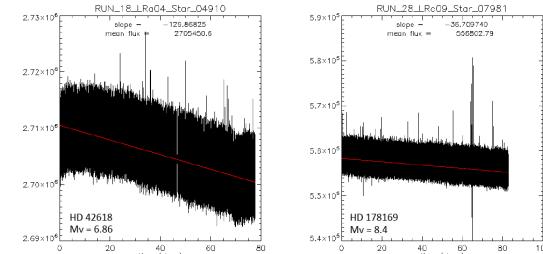

CHEOPS Workshop - Madrid - 18 june 2015

33

## Effects of the radiations

- Drop of the overall transmission of the dioptric chain (objective (6 lenses), window, prisms)
- Drop of the quantum efficiency
  - Estimated over 1 run duration (5 months) and several years when a star is re-observed

Photometric loss of about 10% in 6 years

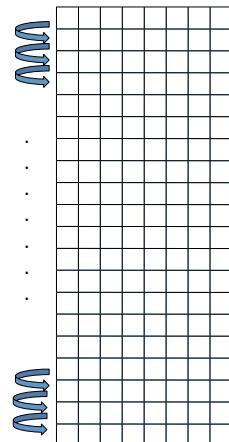

CHEOPS Workshop - Madrid - 18 june 2015

34

## Charge transfer inefficiency

- CTI = 1-CTE
- CTI=  $10^{-4}$  for STIS (HST) after 7 years at alt = 500 km
- Loss of about 10% max of the e- during the readout process, i.e 0.11 mag for a 1K CCD
- Strongly depends on the detector type and the instrument altitude
- Cannot be seen on the CoRoT star windows
- Cannot be seen on the CoRoT background windows

CHEOPS Workshop - Madrid - 18 june 2015

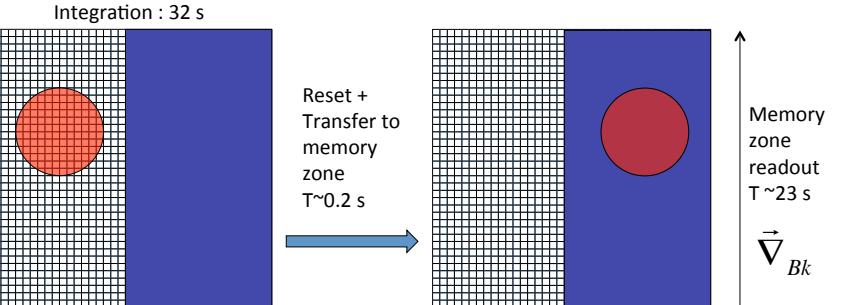

35

## Dark current

- Negligible at CoRoT's launch
- Increase with time (and radiation exposition)

A slope appears on the background due to the readout time

CHEOPS Workshop - Madrid - 18 june 2015

36

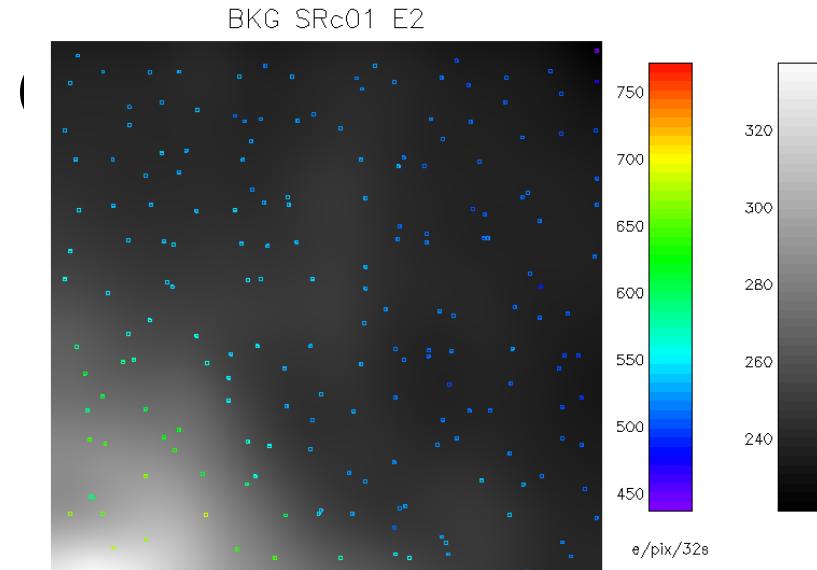

## reminders

- 196 sky background windows on the CCD : 147 windows @ 512s, 49 windows @ 32s
- The CCD is split in 14\*14 square zones, 1 window per zone;  $\sim 3/4$  sampled @512s and 1/4 sampled @ 32s (starting at SRc01)
- Several methods proposed for the background correction:
  - Subtraction of the nearest background window value
  - Subtraction of the combination of the 3 nearest background windows value
  - Subtraction of a sky background model
- The first two methods are very sensitive to hot pixels => subtraction of the median value of all the background windows
  - Small sensitivity to hot pixels
  - Same correction for the whole CCD
    - OK at the beginning (no dark current, uniform background)
    - Not OK with ageing (cf. dark current and readout process)

CHEOPS Workshop - Madrid - 18 june 2015

37

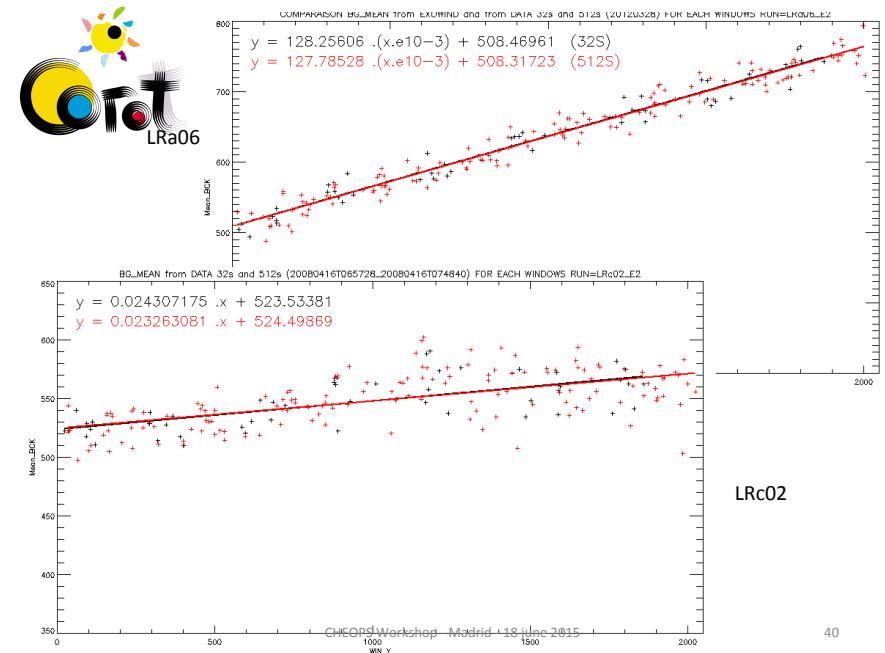

## Sky backgrounds components

- The effective sky background
- The satellite environment : uniform effect, well corrected by the median value
- The dark current
  - A uniform value (integration phase) corrected by the median value
  - Depends on the position of the window (Y-axis) during the readout phase
    - Small effect at the beginning of the mission
    - The gradient increases with time
  - Depends on the CCD temperature
- Need to correct the lightcurves from the dark current

CHEOPS Workshop - Madrid - 18 june 2015

39

40

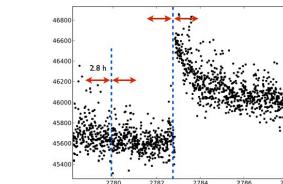

## Adopted correction (A. Deru)

- Subtraction of a median sky background depending on time (unchanged) : correction of the real sky background + dark current during integration
- Subtraction of a component depending on the position of the window : correction of the dark current during readout
- $\text{Dark}(y) = \alpha * y + \text{Cte}$ 
  - $\alpha$  : mean of the slopes at the beginning and end of the run
  - Cte =  $\text{Dark}(0) - \text{Median\_bk}(0)$
  - Ex : for Corot\_ID=223942686
    - SRa01 :  $y = 409$  ; Cte =  $-13,17 \text{ e-/pix/32s}$  ;  $-1\ 172,21 \text{ e-/32s}$
    - SRa05 :  $y = 196$  ; Cte =  $-122,62 \text{ e-/pix/32s}$  ;  $-9\ 442,02 \text{ e-/32s}$
    - To be compared with the minimal values 660 000 et 690 000 e-/32s

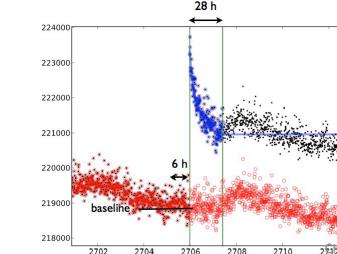

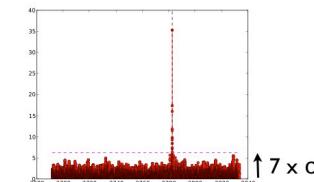

CHEOPS Workshop - Madrid - 18 june 2015

41

## Jump corrections (effects of impacts) (J-M Almenara)

$$S = \frac{|\bar{x}_1 - \bar{x}_2|}{\sqrt{\frac{\sigma_1^2 + \sigma_2^2}{N}}}$$

$$F' = \frac{F}{c_0 + c_1 t + e^{c_2(t-c_3)}} \text{ baseline}$$

$$F' = \frac{F}{b + e^{c(t-d)}} \quad \text{with } c \leq 0$$

CHEOPS Workshop - Madrid - 18 june 2015

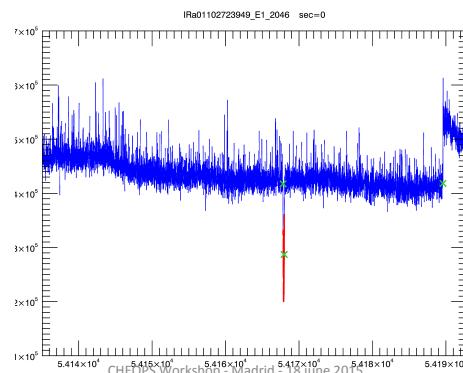

42

## Jump corrections

Jump detection coupled with ephemerides of known phenomena (planetary transits, binary systems...) for negative jumps

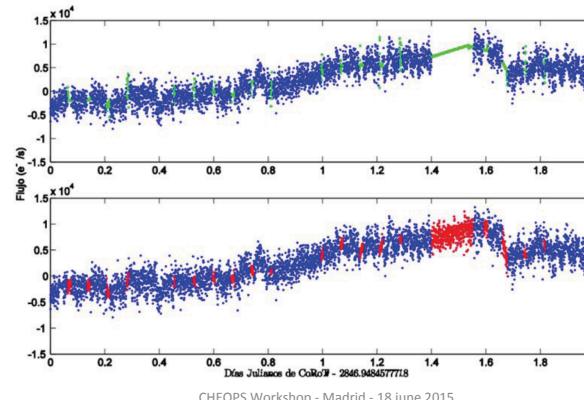

43

## Gap filling

Filling the gap without changing the Fourier spectrum

CHEOPS Workshop - Madrid - 18 june 2015

44

## Gap filling

2 methods tested :

- ARMA : J-P Granado : sliding average and self regressive algorithm.
- Inpainting : CEA Algorithm (R. Garcia, S. Pires)

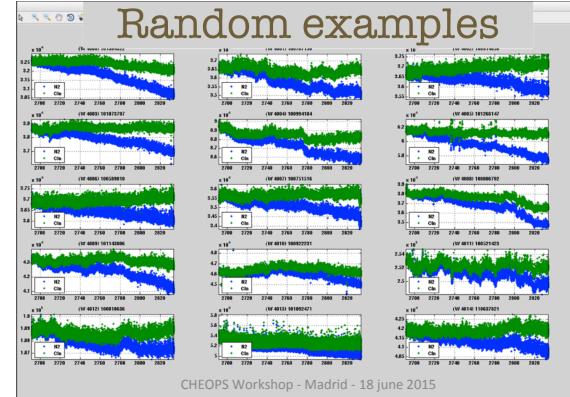

Inpainting method implemented

- 2 correction steps to correct mainly SAA crossing and longer gaps.

## Systematics correction

- Estimation of localised biais on the detector with time.

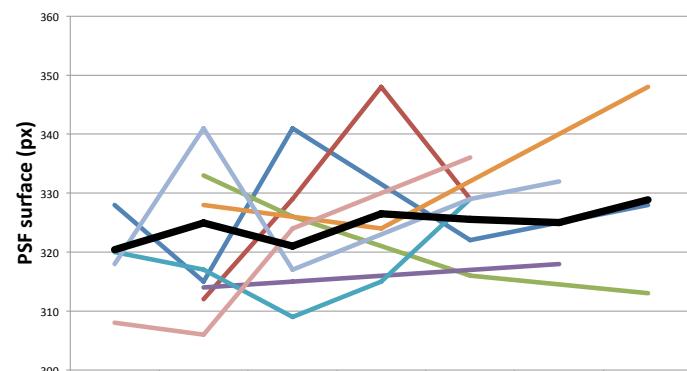

## Systematics correction

- Computation for each run of correction coefficients for each point of the LC
- Need the gap filled and jump corrected data to reduce the biases

## Evolution of the PSF size (focus variations ?)

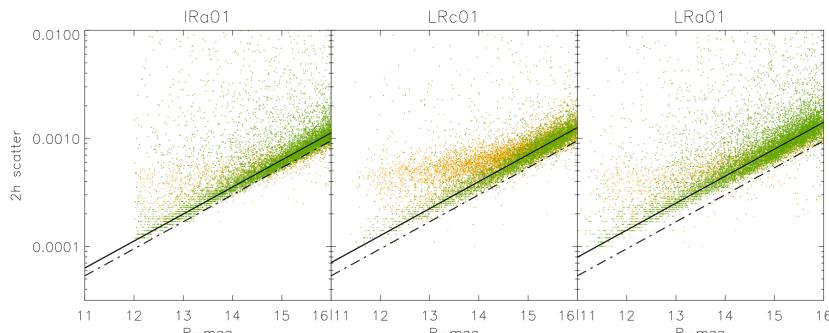

Colors = positions on the A1 CCD

## Overall increase of the noise with time (Aigrain et al. 2009)

- Estimation of the variation of the 2h data scatter using the Median Absolute Deviation method

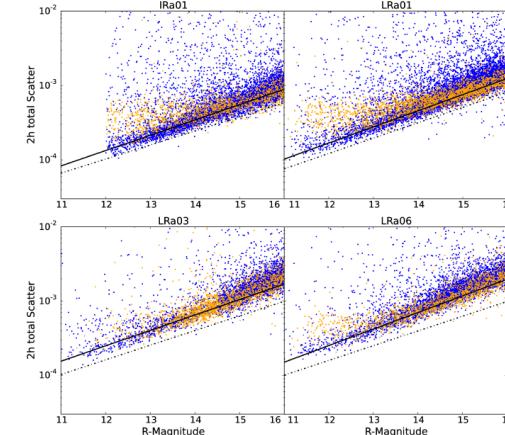

CHEOPS Workshop - Madrid - 18 june 2015

49

## Overall increase of the noise with time (R.Asenso : Master Thesis)

- Estimation of the variation of the 2h data (with the method used by Aigrain et al. 2009) over 6 years

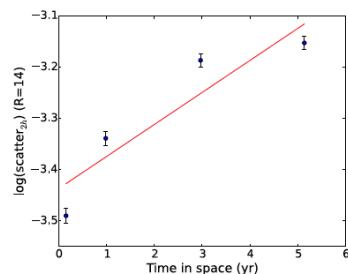

50

## Overall increase of the noise with time (R.Asenso : Master Thesis)

- Estimation of the variation of the 2h data scatter for R=14 with time using the Median Absolute Deviation method (used by Aigrain in 2009) using several CoRoT runs over 6 years

- However : no observation of transmission or QE loss...

CHEOPS Workshop - Madrid - 18 june 2015

51

## Conclusions

- High accuracy photometry is difficult, but not impossible
- Initial and inflight calibrations / monitoring are mandatory. Investigation tools should be foreseen.
- The data reduction pipelines role is crucial. The time required to make them work should not be under-estimated
- Ageing is real, but does not prevent from good observations and science if ageing can be monitored.

CHEOPS Workshop - Madrid - 18 june 2015

52

## Lesson 6 : the force of a project is the force its team

CW 11 @ IAC

CHEOPS Workshop - Madrid - 18 june 2015

53

Corolar lesson : Don't be attracted by the dark side of the force....(hum... sorry, it is another story)...

CHEOPS Workshop - Madrid - 18 june 2015

54

Last lesson : life continues after  
CoRoT CHEOPS

CHEOPS Workshop - Madrid - 18 june 2015
