

The CHEOPS - K2 synergies

Enric Palle, IAC

On behalf of :

- CHEOPS Science Team WG-A1 Activities
- ESPRINT collaboration

Kepler - K2 mission

Kepler (K2)

Aperture 0.95 m

FOV 105 deg²

Continuous data ≈80 days

CHEOPS

Aperture 0.32 m

FOV: single star

*Repeated, scheduled visits
over 3-5 years*

Exoplanet science cases K2 - Cheops

- More transits at lower precision
 - Re-observation of K2 planets with only 1 or 2 observed transits, to refine physical parameters
 - Ephemeris recovery for small depths.
 - Cumulative brute force
- Longer observing baseline/ Objects with transient properties
 - “Evaporating” planets (KIC 1225792b; Rappaport et al 2013)

GTC spectro-photometry data

Exoplanet science cases K2 - Cheops

- More transits at lower precision
 - Re-observation of K2 planets with only 1 or 2 observed transits, to refine physical parameters
 - Ephemeris recovery for small depths.
 - Cumulative brute force

- Longer observing baseline/ Objects with transient properties
 - “Evaporating” planets (KIC 1225792b; Rappaport et al 2013)
 - Orbital decay candidates
 - Transit timing/duration variation monitoring
 - Buildup of SNR for asymmetric transits (gravity darkening)

Science cases K2 Cheops

CoRoT-29b (Cabrera et al, 2015)

How many targets can K2 provide for Cheops ?

Three different estimations:

- From models (+ Kepler)
- From Kepler statistics
- From real observations, K2 campaigns 0 to 2

1. Model populations

- Evaluate the exoplanet yield from K2 with specific magnitude cuts
- Consider all late-type stars with good transit performance:
 - F8 to M-type stars
 - Dwarfs and subgiants
 - $V < 12$ & $V < 10$
- Consider period intervals to evaluate occurrence rate of transits of:
 - Heavily irradiated planets ($P < 10$ d)
 - Mildly irradiated planets ($10 < P < 40$ d)
 - Planets with 2 transits detected by K2 ($40 < P < 80$ d)
 - Planets with 1 (or 0!) transit detected by K2 ($P > 80$ d)

Star counts

- Use of Besançon Galaxy model (Robin et al. 2003 & updates)
 - F8-M9 stars; luminosity class IV & V; $V < 12$
- Tests also with TRILEGAL (Girardi et al. 2005 & updates)
- Results show 60-70% dwarfs & 30-40% subgiants

- Consistency checks

- Field 0:
 - Model: All stars to $V < 12 \Rightarrow 13752$
 - EPIC catalog to $K_p < 12 \Rightarrow 14501$
- Field 1:
 - Total K2 targets $\Rightarrow 21650$
 - K2 Targets with $K_p < 12 \Rightarrow 3100$
- Kepler field:
 - KIC catalog: $T_{\text{eff}} < 6200$, $\log g > 3.5$, $K_p < 12 \Rightarrow 2381$
 - Besançon model $V < 12 \Rightarrow 1700$
 - TRILEGAL model $K_p < 12 \Rightarrow 1320^*$

K2 Field #	Nstars ($V < 12$)	Nstars ($V < 10$)
0	1476	128
1	1285	104
2	1717	137
3	1407	121
4	1495	136
5	1404	118
6	1423	125
7	1312	107
8	1740	119
9	1710	137
TOTAL	14969	1232

Kepler statistics & planet classes

- Planet counts from Kepler statistics using Fressin et al. prescription but updated with new results (Burke catalog & Kepler detection model)
- No geometric bias correction, i.e., direct planet detection rates
- Assume same distribution with stellar mass (seems OK comparing with Dressing & Charbonneau 2013)

Planet type	Radius (R_{\oplus})	<Radius> (R_{\oplus})
Super-Earths (SE)	1.4-2.2	1.8
Small Neptunes (SN)	2.2-3.0	2.6
Neptunes (N)	3.0-6.0	4.0
Jupiters (J)	6.0-22.0	10.0

Number of transiting planets

Type	Nplanets (V < 12)	Nplanets (V < 10)	Type	Nplanets (V < 12)	Nplanets (V < 10)
H_Irrad SE	70.15	5.88	H_Irrad NE	12.95	1.07
L_Irrad SE	61.48	5.08	L_Irrad NE	17.74	1.46
2_Transits SE	17.54	1.44	2_Transits NE	7.00	0.58
1_Transit SE	14.71	1.21	1_Transit NE	7.82	0.64
H_Irrad SN	23.37	1.92	H_Irrad JU	6.66	0.55
L_Irrad SN	36.93	3.04	L_Irrad JU	4.79	0.39
2_Transits SN	12.86	1.06	2_Transits JU	3.28	0.27
1_Transit SN	8.55	0.70	1_Transit JU	7.01	0.58

- Total planets $V < 12 \Rightarrow 313$
- Total planets $V < 10 \Rightarrow 26$
- Overall 2.09% transiting planet occurrence

2. Kepler extrapolation

- Use of KOI catalog of candidates (last vet update 30-10-2014)
- Currently 3196 KOIs as candidates OR confirmed
- Number of observed stars 206150
- Nstars (kepmag <12) = 15878
- Nstars (kepmag <10) = 2117

Kepler Field	Period (d)	Radius (R _e)	N total	N (kep < 12)	N (kep < 10)	N (kep<12 & sigma ind>7)
2_Transit SE	40-80	1.4-2.2	71	3	0	0
1_Transit SE	80-160	1.4-2.2	50	4	0	0
2_Transit SN	40-80	2.2-3.0	78	2	0	0
1_Transit SN	80-160	2.2-3.0	56	3	0	0
2_Transits N	40-80	3.0-6.0	52	5	1	1
1_Transit N	80-160	3.0-6.0	106	4	0	0
2_Transits JU	40-80	6.0-22.0	38	2	0	0
1_Transit JU	80-160	6.0-22.0	40	4	1	0

- Assume same number of bright targets for all 10 K2 fields $\rightarrow \times 10$
- Assume same fraction of giants, same success in selection of dwarfs (!)
- Assume same detection efficiency in K2 as in Kepler (!)

Kepler Field	Period (d)	Radius (R _e)	N (kep < 12)	N (kep < 10)	N (kep < 12 & sigma ind > 7)	S/N in CHEOPS (V = 12)	S/N in CHEOPS (V = 10)
2_Transit SE	40-80	1.4-2.2	30	0	0	Bad	Limit
1_Transit SE	80-160	1.4-2.2	40	0	0	Bad	Limit
2_Transit SN	40-80	2.2-3.0	20	0	0	Limit?	OK
1_Transit SN	80-160	2.2-3.0	30	0	0	Limit?	OK
2_Transits N	40-80	3.0-6.0	50	10	10	OK	OK
1_Transit N	80-160	3.0-6.0	40	0	0	OK	OK
2_Transits JU	40-80	6.0-22.0	20	0	0	OK	OK
1_Transit JU	80-160	6.0-22.0	40	10	0	OK	OK

Probably feasible from ground

Feasible from ground

- Total planets kep < 12 (1 or 2 transits) $\Rightarrow 270$
- Total planets kep < 10 (1 or 2 transits) $\Rightarrow 20$
- Small number statistics, especially in kep < 10
- Number of targets where ONLY CHEOPS can help: ≈ 100 (*very* optimistic)

3. Real observations from K2

- Several programs on-going on to search for transits in the K2 Mission data releases (*Data here only from one*)
- Field 0, 1 & 2 data already explored for planet detections, all stars included.
- False positives not completely accounted for but expected low
- Total of 62 planet candidates
- Systems with 1 transits unaccounted for

Results Field 0

Kepler Field	Radius (R _e)	N (kep>12)	N (kep < 12)	N (kep < 10)	S/N in CHEOPS (V = 12)	S/N in CHEOPS (V = 10)

>2_Transit JU	6.0-22.0	3	1	0	OK	OK

A total of 16, **31**, 15 candidates in 3 fields
(extrapolating x10 during the mission to 310)

Summary

Estimation from three different methods give us an idea of how many interesting target for CHEOPS can K2 provide:

- #planets $K_p < 12$ 313, 270, 20(-50)
- #planets $K_p < 10$ 26, 20, 0(-10)

Summary

On the other hand, so far K2 provides *really interesting* planets:

Summary

On the other hand, so far K2 provides *really interesting* planets:

- M star with 3 planets (Crossfield et al, 2015)

FIG. 1.— *Top*: Calibrated K2 photometry for K2-3. Vertical ticks indicate the locations of each planets' transits. *Bottom*: Phase-folded photometry and best-fit light curves for each planet.

Summary

On the other hand, so far K2 provides *really interesting* planets:

- M star with 3 planets (Crossfield et al, 2015)
- New, slightly brighter, “evaporating” system (Sanchis-Ojeda et al, 2015)

Summary

On the other hand, so far K2 provides ***really interesting*** planets:

- M star with 3 planets (Crossfield et al, 2015)
- Evaporating system (Sanchis-Ojeda et al, 2015)
- TTVs systems in resonance (Armstrong et al, 2015)

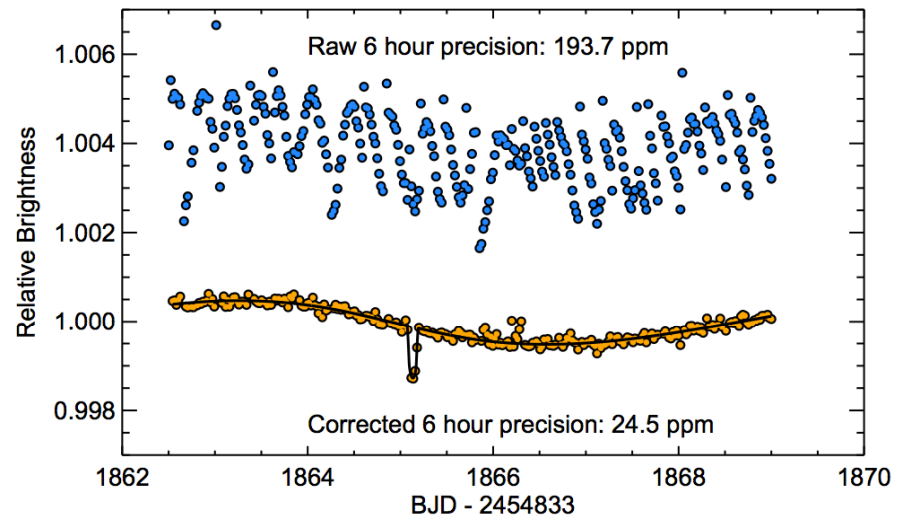

**One of the closest planet pairs to the 3:2 Mean Motion Resonance, confirmed with K2 observations and Transit Timing Variations:
EPIC201505350[★]**

David J. Armstrong¹, Dimitri Veras¹, Susana C. C. Barros², Olivier Demangeon², James McCormac¹, Hugh P. Osborn¹, Jorge Lillo-Box³, Alexandre Santerne^{2,4}, Maria Tsantaki⁴, José-Manuel Almenara^{5,6}, David Barrado³,

Summary

On the other hand, so far K2 provides ***really interesting*** planets:

- M star with 3 planets (Crossfield et al, 2015)
- Evaporating system (Sanchis-Ojeda et al, 2015)
- TTVs systems in resonance (Armstrong et al, 2015)
- A Super Earth around a bright ($V=10.1$) nearby star (Vanderburg et al, 2015)

Summary

On the other hand, so far K2 provides ***really interesting*** planets:

- M star with 3 planets (Crossfield et al, 2015)
- Evaporating system (Sanchis-Ojeda et al, 2015)
- TTVs systems in resonance (Armstrong et al, 2015)
- A Super Earth around a bright ($V=10.1$) nearby star (Vanderburg et al, 2015)
- A few planets to be announced
